7. sprint 2

8. Burndown Chart

Reflection Questions

1. Did your estimations reflect the actual effort?

Yes, the estimations were reasonably appropriate for this simulated sprint. The selected stories had story point estimates based on their expected complexity and effort. Since this was a simulation rather than actual development work, the estimates represent planned effort rather than measured real-world effort.

2. Was your backlog well-prioritized?

Yes. The backlog was prioritized by placing the foundational mentor-related functionality first. The first sprint focused on Manage Mentor Profile, Define Technical Domain Specializations, and

Configure Mentor Availability Slots, which are important features that provide a foundation for later functionality.

3. How did your simulated sprint align with your plan?

The simulated sprint aligned with the original plan. The three selected user stories were included in SBL2 Sprint 1, completed during the simulation, and moved through the workflow to Done. This shows that the sprint execution followed the planned scope and goal.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed the total planned work decreasing from approximately 11 story points toward zero over the two-week sprint. It provides a visual way to understand whether the team is completing work at a pace that allows the sprint goal to be achieved. For this simulated sprint, it represents a team capacity of roughly 11 story points for the selected sprint scope.
